PATENT APPLICATION SERIAL NO. 09/645.866

Amendments To The Claims:

 (Previously Presented) A method for packet bypass in a communications network with an asymmetrical upstream and downstream transmission rate, comprising: receiving a plurality of packets;

determining whether each packet is a bypass packet or a non-bypass packet; optimally selecting a maximum number of bypass packets to communicate between two non-bypass packets to maximize the downstream transmission rate without substantially interfering with the upstream transmission rate;

communicating the non-bypass packets toward a communication link; and communicating a plurality of the bypass packets toward the communication link between communication of two of the non-bypass packets,

wherein each bypass packet comprises an acknowledgment message, and wherein each bypass packet comprises a Transmission Control Protocol (TCP) packet containing an acknowledgment message.

- 2. (Canceled)
- 3. (Original) The method of Claim 1, wherein determining whether each packet is a bypass packet or a non-bypass packet comprises determining a size of the packet.
- 4. (Original) The method of Claim 3, wherein determining the size of the packet comprises classifying packets having a size smaller than a specified size as bypass packets.
- 5. (Original) The method of Claim 1, wherein determining whether each packet is a bypass packet or a non-bypass packet comprises determining a content of the packet.
 - 6. (Canceled)
- 7. (Original) The method of Claim 1, wherein determining whether each packet is a bypass packet or a non-bypass packet comprises determining at least one of a size of the packet, a protocol used to generate the packet, and a content of the packet.
- 8. (Previously Presented) A method for packet bypass in a communications network, comprising:

2002P00640US Response to Office Action mailed from USPTO on Jan 10, 2006.doc

PATENT APPLICATION SERIAL NO. 09/645.866

receiving a phirality of packets;

determining whether each packet is a bypass packet or a non-bypass packet; communicating the non-bypass packets toward a communication link; and communicating a plurality of the bypass packets toward the communication link between communication of two of the non-bypass packets,

wherein determining whether each packet is a bypass packet or a non-bypass packet comprises:

determining a size of the packet;

if the packet does not have a specified size, classifying the packet as a non-bypass packet, otherwise determining a protocol used to generate the packet;

if the packet was not generated using a specified protocol, classifying the packet as a non-bypass packet, otherwise determining a content of the packet; and

if the packet does not include at least a portion of a specified content, classifying the packet as a non-bypass packet, otherwise classifying the packet as a bypass packet.

- 9. (Original) The method of Claim 1, further comprising determining a maximum number of bypass packets that can be communicated between communication of two of the non-bypass packets.
- 10. (Original) The method of Claim 1, further comprising storing each bypass packet and each non-bypass packet in a memory wherein the bypass packets and non-bypass packets can be selectively retrieved from the memory.
 - 11. (Original) The method of Claim 10, wherein the memory comprises:
 - a bypass memory operable to store bypass packets; and
- a transmit memory separate from the bypass memory and operable to store nonbypass packets.
- 12. (Previously Presented) The method of Claim 1, wherein the communication link comprises an Asymmetrical Digital Subscriber Line residing between a modern and a central office switch.

PATENT APPLICATION SERIAL NO. 09/645.866

- 13. (Original) The method of Claim 1, wherein the communication link comprises at least one of a universal serial bus, a Peripheral Component Interconnect local bus, or an Ethernet connection, residing between a host and a modern.
- 14. (Previously Presented) A system for packet bypass in a communications network having an asymmetrical communications link with an upstream and downstream bandwidth with different sizes, comprising:

at least one computer readable medium; and

software encoded on the computer readable medium, the software operable when executed to:

receive a plurality of Transmission Control Protocol (TCP) packets;

determine whether each packet is a bypass packet or a non-bypass packet;

communicate the non-bypass packets upstream toward the asymmetrical a

communication link; and

communicate a plurality of the bypass packets upstream toward the asymmetrical communication link between communication of two of the non-bypass packets,

wherein the software is operable to communicate up to a specified maximum number of bypass packets between communication of two non-bypass packets and wherein the maximum number is optimally selected to maximize the downstream bandwidth.

- 15. (Original) The system of Claim 14, wherein each bypass packet comprises an acknowledgment message.
- 16. (Original) The system of Claim 14, wherein the software is operable to determine whether each packet is a bypass packet or a non-bypass packet by determining a size of the packet.
- 17. (Original) The system of Claim 16, wherein determining the size of the packet comprises classifying packets having a size smaller than a specified size as bypass packets.
- 18. (Original) The system of Claim 14, wherein the software is operable to determine whether each packet is a bypass packet or a non-bypass packet by determining a content of the packet.

PATENT APPLICATION SERIAL NO. 09/645,866

19. (Canceled)

- 20. (Original) The system of Claim 14, wherein the software is operable to determine whether each packet is a bypass packet or a non-bypass packet by determining at least one of a size of the packet, a protocol used to generate the packet, and a content of the packet.
- 21. (Original) The system of Claim 14, wherein the software is operable to determine whether each packet is a bypass packet or a non-bypass packet by:

determining a size of the packet;

if the packet does not have a specified size, classifying the packet as a non-bypass packet, otherwise determining a protocol used to generate the packet;

if the packet was not generated using a specified protocol, classifying the packet as a non-bypass packet, otherwise determining a content of the packet; and

if the packet does not include at least a portion of a specified content, classifying the packet as a non-bypass packet, otherwise classifying the packet as a bypass packet.

22. (Canceled)

- 23. (Original) The system of Claim 14, wherein the software is further operable to store each bypass packet and each non bypass packet in a memory wherein the bypass packets and non-bypass packets can be selectively retrieved from the memory.
 - 24. (Original) The method of Claim 23, wherein the memory comprises:
 - a bypass memory operable to store bypass packets; and
- a transmit memory separate from the bypass memory and operable to store nonbypass packets.
- 25. (Original) The system of Claim 14, wherein the communication link comprises an Asymmetrical Digital Subscriber Line residing between a modern and a central office switch.

PATENT APPLICATION SERIAL NO. 09/645.866

- 26. (Original) The system of Claim 14, wherein the communication link comprises at least one of a universal serial bus, a Peripheral Component Interconnect local bus, or an Ethernet connection, and resides between a host and a modem.
 - 27. (Canceled)
 - 28. (Canceled)
- 29. (Previously Presented) A system for packet bypass in a communications network having an asymmetrical communications link with an upstream and downstream bandwidth that are different sizes, comprising:
- a communications manager operable to receive a plurality Transmission Control Protocol (TCP) packets and to determine whether each packet is a bypass packet or a non-bypass packet; and
- a memory accessible to the communications manager and operable to receive bypass packets and non-bypass packets from the communications manager;

wherein the communications manager is further operable to retrieve bypass packets and non-bypass packets from the memory and to communicate upstream toward the asymmetrical communication link a plurality of the bypass packets between communication of two of the non-bypass packets,

wherein the downstream bandwidth is larger than the upstream bandwidth, and wherein the communications manager is operable to communicate up to a specified maximum number of bypass packets between communication of two non-bypass packets,

wherein the communications manager is operable to determine whether each packet is a bypass packet or a non-bypass packet by determining a size of the packet.

30. (Original) The system of Claim 29, wherein the communications manager is operable to classify all packets having a size smaller than a specified size as bypass packets.

31-33. (Canceled)

PATENT APPLICATION SERIAL NO.

34. (Previously Presented) A system for packet bypass in a communications network having an asymmetrical communications link with an upstream and downstream bandwidth that are different sizes, comprising:

a communications manager operable to receive a plurality Transmission Control Protocol (TCP) packets and to determine whether each packet is a bypass packet or a nonbypass packet; and

a memory accessible to the communications manager and operable to receive bypass packets and non-bypass packets from the communications manager;

wherein the communications manager is further operable to retrieve bypass packets and non-bypass packets from the memory and to communicate upstream toward the asymmetrical communication link a plurality of the bypass packets between communication of two of the non-bypass packets,

wherein the downstream bandwidth is larger than the upstream bandwidth, and wherein the communications manager is operable to communicate up to a specified maximum number of bypass packets between communication of two non-bypass packets,

wherein the communications manager is operable to determine whether each packet is a bypass packet or a non-bypass packet by:

determining a size of the packet:

if the packet does not have a specified size, classifying the packet as a non-bypass packet, otherwise determining a protocol used to generate the packet;

if the packet was not generated using a specified protocol, classifying the packet as a non-bypass packet, otherwise determining a content of the packet; and

if the packet does not include at least a portion of a specified content, classifying the packet as a non-bypass packet, otherwise classifying the packet as a bypass packet.
